Visual Guide

Endpoint Detection & Response —
see everything, stop attacks in progress.

ANIMATED WALKTHROUGH
Step through pages to play the animation

STEP 1/6

Endpoint Telemetry

The sensor sees what the OS sees.

Processes
parent/child trees

Network
connections, DNS

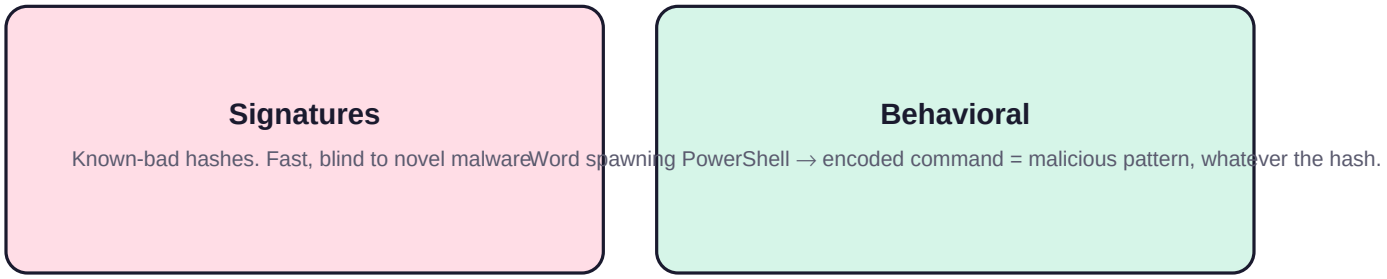
Files/registry
writes, persistence

Rich telemetry streams to the cloud console in near-real time — months of history per endpoint, queryable in seconds.

STEP 2/6

Behavioral Detection

Catch the technique, not just the file hash.



Attackers recompile in seconds — behavior is the durable signal. Map detections to MITRE ATT&CK techniques.

STEP 3/6

Response Actions

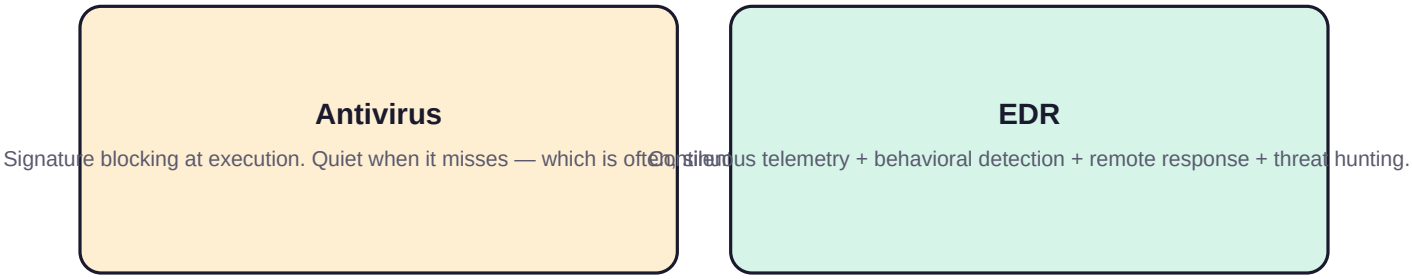
Detect is half the job — respond from the console.

- Network isolation: cut the host off but keep the EDR channel alive.
- Kill process trees and quarantine files remotely — seconds, not tickets.
- Rollback: restore encrypted/altered files from protected snapshots (vs ransomware).
- Collect forensic artifacts (memory, disk) before remediation wipes evidence.

STEP 4/6

EDR vs Traditional Antivirus

Prevention-only vs detect-and-respond.



AV asks 'is this file known-bad?'. EDR asks 'is this behavior malicious?' — and gives you the tools to answer what happened.

STEP 5/6

Deployment & Tuning

Coverage and signal quality decide everything.

- 100% coverage: every endpoint including servers, Macs, Linux — attackers find the gap.
- Tamper protection on: malware's first move is killing the sensor.
- Tune in monitor mode first; aggressive auto-isolate without tuning causes self-DoS.
- Test with simulated attacks regularly — an untested EDR is a hope, not a control.

STEP 6/6

Investigating an Alert

The 10-minute triage flow.

1. Process tree — what launched what? 2. Timeline — what happened before/after?

scope

3. Prevalence — one host or fifty? 4. Intel — known-bad indicators?

blast radius

5. Contain → collect → remediate → document

act

STEP ✓/✓

Key Takeaways

EDR — Remember

- EDR streams process, network, and file telemetry to a queryable console.
- Behavioral detection catches techniques; signatures only catch known files.
- Respond remotely: isolate, kill, quarantine, rollback — in seconds.
- EDR ≠ antivirus: it's detection + investigation + response, not just blocking.
- Demand 100% coverage with tamper protection; tune before auto-isolating.
- Triage fast: process tree, timeline, prevalence, then contain and document.
